

Live Demo Walkthrough

A judge-ready walkthrough of what to click, what changes, and why FairFlow is built around better systems, not bigger bets.

READINESS

Presenter move

Open with one sentence: FairFlow is a paper-only AI trading safety layer that proves when a market is fair enough for retail users and when no-trade is the healthiest action.

Start At The Top Of The UI

Show the judge that this is a live, inspectable trading system before discussing any strategy result.

1 Select symbol

BTCUSDT is the default demo asset, but the dropdown also includes ETH, SOL, BNB, XRP, LINK, ADA, and DOGE.

2 Scenario tabs

Use Calm to show guarded approval, then Manipulated to prove no-trade restraint.

3 Telemetry strip

Point to fairness, liquidity, spread, anomaly score, and the audit hash. These are the inputs the agents reason over.

Use The Runway As The Judge Map

What to say

The score is not a return claim. It is a readiness signal across BGA ethos, technical depth, risk management, and transparency.

Calm Does Not Mean Unrestricted Trading

In calm conditions, approval is small, paper-only, and conditional.

ACTION

SHORT

Paper-only strategy result

FAIRNESS

89/100

Retail participation score

HIDDEN COST

3.8 bps

Spread plus estimated friction

LIQUIDITY

80/100

Market depth and route quality

Click path

1 Click Show calm approval

The UI returns to the approved calm path and refreshes the audit state.

2 Point to Paper execute

This is paper execution only. It demonstrates guardrails without placing exchange orders.

3 Explain conditional approval

The trade is allowed only because fairness, cost, liquidity, anomaly, and stress checks stay inside policy.

Judge takeaway: FairFlow can approve action, but the approval is narrow and auditable.

The Strategy Agent Does Not Act Alone

FairFlow is agentic because multiple specialist agents can challenge, downgrade, or block the proposed action.

1 Strategy

Proposes a direction and confidence.

2 Risk

Checks sizing, volatility, and liquidation stress.

3 Manipulation

Looks for spoofing, imbalance, and anomaly risk.

4 Execution

Chooses post-only, TWAP, maker ladder, or no route.

5 Fairness

Tests retail cohorts and hidden-cost burden.

6 Audit

Turns the decision into a verifiable receipt.

What to say

This is not a thin API wrapper. The UI exposes a committee: proposal, critique, policy, route, fairness, red-team, and proof. The safest valid output can be no trade.

Switch To Manipulated And Let The System Refuse

Th

NO_TRADE

Fairness 50/100

Anomaly 100/100

Liquidity 28/100

Click Show no-trade or the Manipulated tab. The route locks, paper execution is blocked, and the report explains the failed guardrails.

Same asset

BTCUSDT does not change. Only the market health changes.

Different decision

The agents block the trade because the market is no longer fair enough.

No-trade is success

The project is judged on safer systems, not forced execution.

Proof surfaces to open

- /api/audits/966f119ed112.../evidence-pack
- /api/audits/966f119ed112.../receipt
- /api/audits/966f119ed112.../execution-router
- /api/audits/966f119ed112.../policy-stress
- /api/audits/966f119ed112.../anchor-proof

Judge takeaway: the demo does not ask for trust. It gives a verification trail.

A Natural 2-Minute Presentation Flow

This PDF is designed to become a short narrated video without sounding like a feature checklist.

0:00-0:15	Thesis	FairFlow proves when a market is fair enough for retail users.
0:15-0:35	UI orientation	Show symbol, scenario tabs, telemetry, readiness, and audit hash.
0:35-0:55	Calm path	Explain guarded paper approval and conditional execution.
0:55-1:20	Agents	Strategy proposes; risk, fairness, route, red-team, and audit agents challenge.
1:20-1:45	No-trade proof	Switch to manipulated and show the refusal as a successful safety outcome.
1:45-2:00	Close	Evidence pack, receipt, anchor proof, and BGA alignment.

Closing line FairFlow is not bigger bets. It is better market infrastructure: explainable, risk-aware, and verifiable.
